

Build a small web application that serves for clients and a company worker

- Worker need:
  - o Access to a place where they can add/remove products or changing the quantity of them
  - o Access to an order area where they will see the costumers orders and send the product (which automatically updates the inventory) or send feedback in case it is out of stock
- Clients can:
  - o Create a new account or make a login
  - o Access to the available products
  - o A order functionality for those products
  - o A place where they can check the order status

Before starting you will need to build a quick portfolio explaining the application

You will use the following tools to perform this:

- Next.js framework
- MongoDB
- Prettier and ESLint
- GitHub
- Typescript
- MaterialUI
- Postman

Quick Note:

When you are ready to start coding start by the worker product part first because it will give you an important knowledge on how to consume and modify data before moving to something more complex
